TITLE: Method for obtaining synthetic rubber. Class 39, No. 173942

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 83

TOPIC TAGS: rubber, synthetic rubber, butadiene, styrene, polymer, copolymer,
polymerization

ABSTRACT: This Author Certificate presents a method for obtaining synthetic rubber
by polymerization or copolymerization of dienes with vinyl monomers, for example,
butadiene with α -methylstyrene in aqueous emulsion at low temperatures in the
presence of known free-radical-initiators and regulators employing emulsifiers.
To improve the polymer properties, esters of monoalkylbenzoic acid are used as
emulsifiers.

TITLE: Effect of the colloidal-chemical characteristics of soaps on the polymerization kinetics and properties of latex

SOURCE: Kolloidnyy zhurnal, v. 27, no. 6, 1965, 833-838

TOPIC TAGS: particle size, polymerization kinetics, soap, emulsion polymerization

ABSTRACT: The colloidal-chemical characteristics of potassium salts (soaps) of di-tert-butylbenzoic acid (DTBBA) and their relation to the kinetics of emulsion polymerization were studied by carrying out the emulsion copolymerization of divinyl and α -methylstyrene with these soaps and their mixtures. The soaps were found to have a low solubilizing capacity and a high value of the critical concentration of micelle formation (CCMF) as compared to soaps of disproportionated rosin and synthetic fatty acids. The rate of emulsion polymerization is determined primarily by the quantity and nature of the micellar soap present in the system. The quantity of the micellar soap in the mixture undergoing polymerization determines the character of the change

TITLE: Effect of labile bonds on the adhesive properties of rubber mixtures based on pyridine and carboxyl-containing resins/

SOURCE: Kolloidnyy zhurnal, v. 28, no. 5, 1966, 675-677

TOPIC TAGS: rubber adhesive property, synthetic resin, bond formation effect, RUBBER, ADHESIVE BONDING, PYRIDINE

ABSTRACT: To determine the effect of labile hydrogen bonds on the adhesive properties of rubber compositions in the contact zone, mixtures containing rubber 100, Rubrax 5, stearin 2, ZnO 5, and channel black 50 parts were prepared and pressed for 20 min at 55C between aluminum foils to form thin (~4 mm) plates. After 2 and 24 hr standing periods, strips (cut out from the plates) were pressed together for 15 sec under 1 kg pressure and then separated using 300 g weights. The adhesion was indicated by the time of complete separation of the plates. Adhesion of the mixtures varied depending on the rubber used and on the substitution of the other components of the initial mixture. Addition of eight parts of rubresine (a condensation product of p-nonyl-phenol and formaldehyde) to the compositions containing SKMVP-15ARK rubber (a copoly-

ACC NR: AP6032177

mer of 1,3-butadiene and 2-methyl-5-vinylpyridine with 85:15 proportion in the initial mixture) increased the adhesion from 1 min (without rubresine) to 8 min for complete separation. This is attributed to the formation of hydrogen bonds between the phenol and pyridine groups, since the phenol groups are weak acids and the pyridine groups are weak bases. Rubber specimens based on the carboxyl-containing resin SKS-30-1 15 have higher adhesion to each other than that of the pyridine-based rubber SKS-25-MVP-SARK (copolymer of 1,3-butadiene, styrene, and 2-methyl-5-vinylpyridine in proportion of 70:25:5). The adhesion of SKS-30-1 to SKS-25-MVP-SARK was about the same as to SKS-30-1 itself. The increased adhesion of the SKS-30-1 resin is also attributed to the formation of labile bonds. The adhesion of rubbers increased with increasing content of methylvinylpyridine. In all cases, rubbers containing the alkaline lamp black Fillblack O (HAF) have lower adhesion than those with channel black (with acid properties). This is attributed to the higher number of OH groups in the channel black than in the lamp black. The OH groups on the carbon black surface from labile bonds with the pyridine groups of the rubber. Orig. art. has: 2 tables. [PS]

TITLE: The methodology of permanent implantation of intraosseous electrodes in bone marrow for leading off potentials and stimulating it

SOURCE: AN LatSSR. Institut eksperimental'noy i klinicheskoy meditsiny*. Trudy*, no. 34, 1963. Regionarnoye krovoobrashcheniye i mekhanizmy* yego regulyatsii (Regional blood circulation and its regulation mechanisms), 217-223

TOPIC TAGS: electrode, implanted electrode, intraosseous electrode, electrophysiology, bioelectronics, osteoreception

ABSTRACT: A method of implanting silver electrodes in the upper medial part of the rabbit and cat tibia was developed at the Laboratory of Bioelectronics and Electrophysiology, Institute of Experimental and Clinical Medicine, Academy of Sciences Latvian SSR, to assist in determining the functional condition of the bone marrow in healthy animals under approximately natural conditions. The electrodes form an integral part of a rectangular plastic electrode unit which is

Card 1/32

ACCESSION NR: AT4022342

attached to the bone by two metal or plastic screws (see figure). The position of the three electrodes in the bone marrow permits their use individually or in different combinations with either a small or large inter-electrode distance. The electrodes themselves are made of silver wire with a cross-section of 0.4 mm with an inter-electrode separation of 3 mm, and are insulated with BF-2 insulating glue. The implantation surgery seldom resulted in postoperative complications. Positioning of the electrodes in the bone marrow was checked retgenologically and anatomically. An eight-channel "Al'var" encephalograph and an ENO-1 oscillograph which permit recording of both spontaneous and stimulated electrical activity were used; a "neurovar" generator was used to stimulate nerves and bone marrow. The method is designated for physiological studies of osteoreception, particularly in connection with research on conditioned reflexes.

LAZDIN, G. V.

67-1-19/20

AUTHOR: Lazdin, G. V. , Engineer, Consultant

TITLE: Answers to Letters to the Editor (Otvety chitatel'nyam)
To the Comrade V. N. Ol'khovik, Shebekino, Tul'skaya Oblast
(To: Ol'khoviku, V.Ng. Shebekino, Tul'skaya obl.)

PERIODICAL: Kislod, 1958. : Nr 1, pp. 45 - 45 (USSR)

ABSTRACT: Question: Which average amount of cold in kcal. rises in the
block for high-pressure of air and in the turbo-detacher of
the oxygen plant KT-3600 ?

Answer: The equation corresponding to the mentioned plant
runs as follows:

high-pressure low-pressure
 $Q_{\text{throttle effect}} + Q_{\text{throttle effect}} + Q_{\text{basic current}} +$

$+ Q_{\text{detacher}} = Q_{\text{not recuperated}} + Q_{\text{surroundings}}$

Card 1/3

where

Answers to Letters to the Editor. To the Comrade V. N. Ol'khovik, Shchekino,
Tula Oblast

67-1-19/20

high-pressure	
$Q_{\text{throttle effect}}$	denotes the amount of cold of the throttle effect of the high-pressure air (=15350 kcal/h)
low-pressure	
$Q_{\text{throttle effect}}$	denotes the amount of cold of the throttle effect of the low-pressure air (=5950 kcal/h)
$Q_{\text{basic current}}$	denotes the additional amount of cold occurring in consequence of the inequality of the gas flows in the main heat exchanger of the distribution block (13800 kcal/h).
Q_{detacher}	denotes the amount of cold produced by the turbo detacher.
$Q_{\text{not recuperated}}$	denotes the loss of cold because of incomplete regeneration (= 30000 kcal/h);
$Q_{\text{surroundings}}$	denotes the loss of cold through the insulation into the surroundings (=28300 kcal/h).

Card 2/3 From the equation the value 23700 kcal/h results for Q_{detacher} .

67-1-19/20

Answers to Letter to the Editor. To
Tula Oblast

Comrade V. N. Ol'khovik, Shchekino,

Thus the operation regime of the oxygen plant KT-3600, with a cold production with regard to high-pressure air under consideration of the additional cold development occurring in consequence of the inequality of the flows in the main heat exchanger, is 29150 kcal/h. In the turbo detachers (as mentioned above) it is 23700 kcal/h.

TITLE: Caseinolysate — a rich nitrogenous product useful for parenteral feeding

SOURCE: AN LatSSR. Izvestiya, no. 5, 1966, 83-89

TOPIC TAGS: nutrition, protein, hydrolysis, amine, *Biochemistry*

ABSTRACT: Caseinolysate, a name given by the authors to a new protein hydrolysate containing 70% amino nitrogen, is prepared from casein by treatment with pancreatin and kefir yeast (*Bacillus caucasicus*). To evaluate the energy and plastic properties of the preparation for parenteral feeding, experiments were conducted on 3 dogs. In the first stage of the experiments the animals were given only water to reduce body weight by 10 to 15%. In the second stage the animals were administered a daily parenteral feeding of invert sugar (670 kcal/kg) supplemented with thiamin, riboflavin, nicotinic acid and others for 3 days. In the third stage the animals were administered a daily parenteral feeding of caseinolysate (2 g/kg) for 5 days. The following

TITLE: Spectrum Analysis of Preparations of Rare Earths of the Cerium Group With Respect to Samarium

PERIODICAL: Zavodskaya laboratoriya, 1959, Vol 25, Nr 8, pp 958 - 959 (USSR)

ABSTRACT: The article contains a description of a spectrum method for the determination of samarium in compounds of cerium, lanthanum, praseodymium, and neodymium. The graphite electrode is prepared in a 3% polystyrene solution (in benzene) before use. One drop of 0.05 - 25% test solution is placed on the tip of the electrode and evaporated at 100° (Ref 5). The following were used: spectrograph DFS-3, generator DG-1 as exciter, photographic film of type III (sensitivity 4, 5.5 units of GOST) and type II (sensitivity 16 GOST units). The standard samples were prepared from 99.8 - 99.9% oxides of the concerned elements of the rare earths. The concentration was varied in the above-mentioned interval in dependence of the samarium content. The article lists the applied pairs of lines, determination intervals of the samarium concentration for the different basic substances (Table). The

Card 1/2

TITLE: Spectral Determination of Rare Earth Admixtures in Samarium and Europium

PERIODICAL: Zhurnal analiticheskoy khimii, 1960, Vol 15, Nr 1, pp 57-60 (USSR)

ABSTRACT: Spectral determination of all rare earths and yttrium in samarium and europium oxides was studied. Determination was made in two stages: simultaneous determination of all cerium-group elements and simultaneous determination of all yttrium-group elements. A drop of the test solution is placed on the graphite electrode (previously treated with 3% solution of polystyrene in benzene) and dried at 100°. Spectral excitation was made in an alternating current (10 a) arc. Grating spectrograph DFS-3 was used.

Card 1/6 Calibration graph solutions were prepared from pure

Spectral Determination of Rare Earth
Admixtures in Samarium and Europium

77749
SOV/75-15-1-11/29

The spectrograms obtained are given in Fig. 2 and 3. It was shown that rare earths in samarium and europium can be determined by the proposed method with an accuracy of 3-5% within concentration limits shown in the table. Only a small amount (5-10 mg) of the analyzed compound is required. There is 1 table; 3 figures; and 5 references, 2 U.S., 3 Soviet. The U.S. references are: Tasstl, V. A., Wilhelm, H. A., J. Opt. Soc. America, 38, 518 (1948); Tasstl, V. A., Cook, H. D., Spectrochim acta 5, 201 (1952).

TOPIC TAGS: rare earth element, neodymium, europium, lanthanum, cerium, samarium, praseodymium, spectrochemical analysis, chromatographic enrichment, column chromatography

ABSTRACT: The authors describe a technique for increasing the sensitivity of the determination of rare earth elements in neodymium and europium by chromatographic enrichment. The direct spectral method makes it possible to determine La, Ce, Pr and Sm in neodymium at a sensitivity of 0.05-0.1%; after enrichment, the sensitivity can be increased to 0.005%. The conditions of enrichment are given and the spectral analysis data for the chosen neodymium fractions are tabulated. The percentage of praseodymium, neodymium and samarium in the analyzed

neodymium oxide is determined by the formula $X = \frac{a \times 100}{v} \%$, where "a" is the total weight (g) of the element to be determined in the chosen fractions and "v" is the amount of neodymium oxide adsorbed to the resin. Tabulated data show that the sensitivity of the spectrochemical determination of rare earth elements in neodymium oxide is higher by one order of magnitude than that of the direct spectral determination. Even this sensitivity is unsatisfactory for the production of rare earth elements and their high-purity compounds, however, so that the investigation of the best enrichment conditions is being continued. Preliminary studies show that the amalgam reduction of europium, which cannot be enriched chromatographically, makes it possible to increase the sensitivity of the determination of samarium and neodymium in europium up to levels of 0.01%. TITLE: Increasing the sensitivity of the flame-photometric determination of rubidium
in cesium salts

SOURCE: Sibirskoye soveshchaniye po spektroskopii. 1st, Kemerovo, 1962. Spektro-
skopiya; metody* i primeneniye (Spectroscopy; methods and application).
Doklady* soveshchaniya. Moscow, Izd-vo Nauka, 1964, 85-87

TOPIC TAGS: spectroscopy, flame photometry, rubidium determination

ABSTRACT: Using flame photometry, the authors determined rubidium in high-purity cesium chloride and cesium nitrate. The emission intensity of rubidium in the flame was increased 60-70% by the addition of 10 vol. % ethyl alcohol to the cesium salt solution; this made it possible to determine 0.001-0.0008% rubidium in the dry cesium salt. The behavior of the analytical lines of rubidium at 7800-7948 Å upon the addition of sodium chloride and ethyl alcohol was analyzed. On the basis of this study, the determination of rubidium was carried out by using the 7800 Å line. The method was checked by introducing known amounts of rubidium. The sensitivity achieved, $0.8-1 \times 10^{-3}$, is not the maximum attainable value. The authors suggest the use of certain

TITLE: Spectrochemical analysis of high-purity cerium dioxide using concentration on chromatographic columns. 18 27 27

SOURCE: Sibirskoye soveshchaniye po spektroskopii. 1st, Kemerovo, 1962. Spektroskopiya; metody i primeneniye (Spectroscopy; methods and application). Doklady* soveshchaniya. Moscow, Izd-vo Nauka, 1964, 93-95

TOPIC TAGS: spectroscopy, column chromatography, cerium dioxide, rare earth impurity, lanthanum oxide, rare earth oxalate

ABSTRACT: In order to increase the sensitivity of the determination of rare-earth impurities in cerium dioxide and lanthanum oxide (oxides used in the manufacture of glass), the authors used samples enriched by chromatographic concentration of the impurities with ion-exchange columns. The sorbent used was the KU-2 resin. The best desorbent for cerium dioxide was found to be trilon B (0.5% solution, pH 4.5). The experiments were carried out with neodymium, praseodymium, and samarium. The eluted fractions were collected in amounts of 50-100 ml, and the rare earths were

Card 1/2

L 19751-65

ACCESSION NR: AT5000426

precipitated with a saturated solution of oxalic acid. The precipitate of oxalates was ignited, weighed, and analyzed for the content of neodymium, praseodymium, and samarium. In the spectral analysis, the following analytical pairs were used: Pr 4225.33 - Ce 4224.58 Å; ND 4451.57 - Ce 4460.97 Å; Sm 4433.81 - Ce 4436.31 Å. Results show that the relative error of the method was $\pm 4-8\%$. This technique of analysis of cerium dioxide permits the determination of rare earths (Pr, Nd, Sm) present in amounts of 0.001-0.005%, and can be used under plant laboratory conditions. Ed. of Publishing House: P.M. Belyanin; Tech. Ed.: T.F. Soleneva.
PURPOSE: This book is intended for specialists in the field of ma-
chine and instrument manufacture who use radioactive isotopes in
the study of materials and processes.

COVERAGE: This collection of papers covers a very wide field of the
utilization of tracer methods in industrial research and control
techniques. The topic of this volume is the use of radioisotopes
in the machine- and instrument-manufacturing industry. The indi-
vidual papers discuss the applications of radioisotope techniques
in the study of various materials and alloys, problems of friction and lubri-
cation, metal cutting, and performance, and defects in metals.
Several papers are devoted to performance, and defects in the auto-
mation of industrial processes, recording and measuring devices,
quality control, flowmeters, level gauges, and devices for radi-
ation control, etc. These papers represent contributions of ma-
jor Soviet institutes and laboratories. They were published in
Transactions of the All-Union Conference on the Use of Radioac-
tive and Stable Isotopes and Radiation in the National Economy
and Science, April 4-12, 1957. No personalities are mentioned.
References are given at the end of most of the papers.

TABLE I BOOK REFERENCES

Abstracts from 1958. Russian machinebuilding

International Year of Machine Tools (Cutting-Tool Materials)
Moscow, 1958. 104 p. 500 copies printed.

Prof. M. I. Lazebnik, Doctor of Technical Sciences, Professor;
Head of Publishing House: G. B. Gorbunov, Tech. Ed.: E. P. Karginov.

PURPOSE: This collection of articles is intended for scientific personnel
and production engineers engaged in the manufacture and use of cutting tools.

CONTENTS: The collection contains papers read at a seminar on cutting-tool
materials organized and sponsored by the Institute for Technological Machine-
building (Commission on Processing in Machine Building). The seminar investigated
the cutting properties of various tool materials, the effect of
temperature on cutting edges, the problem of wear, and the possibility of
making cutting tools more efficiently. No particularities are mentioned.
References accompany each article. There are 31 references: 19 in Russian and
12 in English.

TITLE: Uses of Caprone in the Radio-Manufacturing Industry

PERIODICAL: Radiotekhn. proiz-vo, 1957, Nr 13, pp 37-39

ABSTRACT: Experimental manufacturing of items cast from caprone is reported. The items possess high physical properties and can be widely used in radio and electronics. Different hardnesses can be imparted to the product depending on casting conditions of the same material. Casting into cold molds (running-water cooled) results in an elastic product. Casting into the same molds preheated to 70-80°C with a subsequent slow (air) cooling results in a harder product. Several remeltings of caprone change its color from milky-white to gray. Wear-resistance tests of caprone showed that it works in well and that subsequently it possesses a very high wear resistance. For this reason, caprone is recommended for use in bearings that have a small specific

Card 1/2

Uses of Caprone in the Radio-Manufacturing Industry

SOV/112-59-4-7891

pressure. A principal drawing of a syringe for caprone casting is presented. For casting, the caprone should be heated to 265-300°C. It is recommended that the heated caprone mass be processed very quickly because at high temperatures, caprone thermal decomposition occurs.

TITLE: Measuring soil density by means of gamma-rays

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 12, 1961, 28, abstract 12V238 (Avtomob. dorogi, 1961, no. 3, 24-25)

TEXT: A field soil gamma-densitometer is described for rapid measurements of soil density. The system of the instrument is based upon passing the gamma-rays through a layer of soil placed between the source and the detector, the recorded intensity being dependent upon the soil density. The described instrument comprises an integrator with a 100 μ A microammeter measuring the grid current of a triode tube, whose anode potential depends upon charging a capacitor by current from a gamma-ray counter-tube. It is possible with the described instrument to determine the soil density at depths down to 25 cm without destroying its structure. The accuracy

of the instrument is approximately $+ 0.03 \text{ g/cm}^3$. Two different constructions of the instrument are described: Fork-and feeler rod-shaped. The basic electronic diagrams and the systems of construction for both types of instruments are given. There are 3 figures. /"Abstractor's note: Complete translation."/

Title: Fastest Procedure for Determining Magnesium in Aluminum Alloys

Original

Periodical: Nejkratsi stanoveni horciku v hlinikovych slitinach. Hutnik (Praha), 1955, 5, No 12, 377-378; Czech

Abstract: Weighed sample of 1 g dissolved in 20 ml 25% NaOH, solution diluted to 150 ml and 1 ml of 3% H_2O_2 added. Residue filtered off and dissolved in 10 ml HNO_3 (1:1) and 2 ml H_2O_2 . Filter washed 2-3 times with water, filtrate evaporated to 10 ml and there are added thereto 5 ml conc. HNO_3 , 4 g $KClO_3$ after which it is boiled for 3 minutes on sand bath (130°). Mixture diluted to 50 ml and MnO_2 filtered off. Filtrate diluted to 150 ml and there are added thereto 0.5 g citric acid, 20 ml 25% solution NH_4Cl , 20 ml 20% solution $(NH_4)_2HPO_4$ after which it is neutralized with NH_4OH (I) to phenolphthalein.

Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 61823

Abstract: After boiling 1 minute added 50 ml I and after passing for 5-10 minutes a current of air through it the $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$ is filtered off. Precipitate washed with water containing 3% I, then with acetone, dried for 2 minutes in vacuum-desiccator. With <0.2% Mg in alloy a 2 g sample is used, with >3% Mg a 0.5 g sample. Duration of analysis 1 hour.
